

## Introduction

- Does the introduction provide appropriate background context for a general reader?
  - Yes, gives a lot of context to why batting order matters
- Includes mention of prior work in this field
- Does the introduction provide a clear motivation for the project?
  - Yes, there is a very clear motivation to improve the performance of the team
- Are there at least some relevant citations included?
  - Clear citations in the introduction.
- Are the research question(s) clearly stated?
  - Yes, there are two clearly stated questions.
- Do the research question(s) follow from the motivation?
  - Yes, very clearly.
- Are the expectations or hypotheses for the research questions clearly stated?
  - It's not clear what the hypothesis is. For example, if they expect to see players with certain features later or earlier in the lineup, and what features are most important in their predictive model, and why that may be.
- Is the goal of the report clearly stated?
  - Yes, the goal is to predict the lineup and the research questions and methods section make the goal of the report very clear.

## Data

- Is the source of the data stated with an appropriate citation?
  - Yes, the Python package is named, and it is clear where the information is coming from.

2

- Is it clear when and how the data was collected?
  - There could be a little bit more detail on how the data was collected. For example, how the Python package works.
- Is data preparation described clearly (missing data, creation of new variables, etc)?
  - Yes, it is very clear how they cleaned their data. They removed rows with missing clean-up positions and I liked how they made it clear why they did these different clean-up steps.
- Does the data look clean and tidy?
  - Yes
- Are the cases and relevant variables described?
  - Yes, there is clear listing of features and good separation between datasets

## Methods

- Do the visualizations correspond to the stated research question?
  - Yes
- Are visualizations effective and do they follow clear visualization principles (including

elements like titles, labels, appropriate for the type of data, etc)?

- The visualizations are clear and the table is also helpful for the paper.
- Are the analytic methods clearly described?
  - Yes, both are clearly described.
- Is the choice of analytic method/approach justified? Are the methods appropriate for the research questions?
  - Yes, it is explicitly stated why both of the two part model is needed and the methods re appropriate.

3

### Results

- Are the chosen techniques for answering the research question appropriate for the research context and type of data?
  - Yes (NN)
- Is the research question answered effectively?
  - Yes

### Discussion

- Is the answer to the research question summarized and supported by evidence?
  - Yes I like the inclusion of the discussion and the limitations of the model due to the real world nature of the data (the changing rules of the game)
  - Clear narrative progression
- Are limitations of the analysis clearly outlined?
  - Yes, the limitations are clear.
- Do the authors reflect on any implications the nature of the training data has for the generalizability of the findings?
  - Yes, there is discussion of injuries, rules of the game, and other real world limitations
- Do the authors reflect on the ethicality and/or societal implications of their work?
  - There is not that much discussion on the ethicality. Maybe talk more about the effect on the worst teams.

### Analysis Code

- Does the code used for analysis look generally correct?
  - The code is well-written syntax-wise

4

- Is the code readable, written in proper style, and commented appropriately?
  - Lots of code is commented out, hard to tell what purpose(s) it serve(d)
- Are there markdown descriptions of the analysis throughout?
  - Yes, there are some markdown cells. However, most seem incomplete and do not

fully describe the code

- Are their code and output (especially plots) accessible?
    - No plots visible in the code file. Most cells are without output or result in errors.
- After fixing some typos and syntax errors, I was able to run the majority of cells

General

- Is the writing clear (including elements like spelling, grammar, etc)? Are you able to follow what is being done?
  - Clear and professional
  - Logical flow
- Is the code clear? Are you able to follow precisely what is being done?
  - Hard to follow in places since code has been run out of order, cells resulting in errors, large blocks commented out, etc.
- Are you able to reproduce all aspects of the report, including output, visualizations, etc?
  - Had difficulty reproducing the report in ipynb file due to missing dependencies and some errors in code, unclear where most of the results in the written report came from
- Is the report well-formatted and readable (including layout but also only reporting relevant output, with no extraneous code, visuals, etc)?
  -
- Have they appropriately outlined the next steps with gaps clearly defined?
  -
- Is their repository well-organized or has it been difficult to find certain files?
  - The repository is well organized, and the analysis file is clear.

5

requirements.txt

- Any suggestions for them moving forward?
  - Make the hypothesis for the research questions more explicit

Final Considerations

- What is one question you have for the group after reading their analysis?
  - How does your prediction model impact sociotechnical systems?
- What is one thing the group has done especially well?
  - The draft is really well written, and the motivation is clearly explained. The research questions clearly come from the motivation.
